Abstract

Turner Syndrome (TS) is the most well-known and common chromosomal disorder accompanied by delayed growth. According to the national register of children with dwarfism in Ukrainian the are 527 girls with TS 0.1-24 y.o. Growth retardation in varying degrees is a common feature for TS.

Methods

We analyzed the database of the Ukrainian National Registry of children with dwarfism (2005-2015 y.y.), that include girls with TS. The Register contains information on the age of first diagnostic of TS, the age at the start of GH therapy, the results of basic clinical examination: height, weight, pubertal stage by Tanner, karyotype, the results of hormonal, instrumental and radiological studies, the results of rGH therapy. It was provided a retrospective analysis in 2005-2014 years of growth parameters at 502 girls with TS aged 1-18 y.o. before growth hormone treatment.

Results

The degree of growth delay (SD) in untreated girls with TS progresses with age: from (-) 1.6±1.3 SD (children aged 1 y.o.) to (-) 3.5±1.2 SD (age >17 y.o.). There was no significant difference in growth in TS girls with different karyotype (monosomy X, mosaic and structural anomalies of chromosome X (p>0.05).

Average final degree growth delay in girls with TS:

<table>
<thead>
<tr>
<th>Karyotype</th>
<th>Mean ± SD</th>
</tr>
</thead>
<tbody>
<tr>
<td>45,X (-)</td>
<td>3.5 ± 0.8</td>
</tr>
<tr>
<td>Mosaic (-)</td>
<td>3.0 ± 2.9</td>
</tr>
<tr>
<td>Structural anomalies X</td>
<td>3.3 ± 0.7</td>
</tr>
</tbody>
</table>

Conclusions

1. There is no difference in degree of growth retardation at TS girls with different karyotype.
2. Growth delayed in TS girls is noticeable from the first year of life, increases with age, and is a greatest in the pubertal age.
3. The mean growth delay in TS girls is -3.1±1.1 SD and is greatest in the age of 14 years.
