**Nonalcoholic steatohepatitis** leading to cirrhosis of the liver as a complication of hypothalamic disorders in a course of cranioopharyngioma - case report

URSZULA WĄTROBIŃSKA, ANNA BENDYSZ, GOŁAŁOWSKA, ELŻBIETA MOSZCZYŃSKA, MIECZYSŁAW SZAŁECKI

1Department of Endocrinology and Diabetology, Children’s Memorial Health Institute
2Faculty of Health Sciences, UJK, Kielce, Poland

**Background:**

Cranioopharyngioma is a low-grade malignant tumor with high survival rate. Its incidence is 0.5 to 2.0 cases per million persons per year. 30% to 50% of all cases occur in the childhood. The tumor location leads to numerous complications like deficits of pituitary function, impairment of vision, neuropsychological deficits and obesity. Excess body fat is observed in 40-50% of cranioopharyngioma patients.

**Case study:**

We present two patients after neurosurgery carried out as treatment of cranioopharyngioma with extreme obesity and liver cirrhosis secondary to NASH.

The first patient is a 17-yr-old girl and the second patient is now 27-yr-old male who was under the care of the Department of Endocrinology in the period from 6 to 18 years of age. In the history both of them were in good condition till age of 6. Since then the symptoms of CNS tumors appeared.

In case of the girl: tumor around the optic chiasm and in the third ventricle was diagnosed.

In case of the boy: MRI CNS showed cystic tumor of the suprasellar region.

**Additional tests:**

</tbody>
</table>

Both of them at 13-15 years of age began to show the symptoms of hepatopulmonary syndrome and liver failure. Based on liver biopsy diagnosed with NASH, after that they underwent liver transplantation (LTX). In the long term observation patients are still obese. A qualification for the bariatric surgery is considered.

**Conclusions:**

The aim of our study is to highlight fatty liver disease as a significant problem in obese children with hypothalamic damage caused by tumor. Thorough, long-term observation of patients and performed examinations may allow for early detection of progress from simple steatosis to steatohepatitis and finally cirrhosis of the liver.
