## Introduction

Dyslipidemia begins and continues in youth and is a major risk factor for adult-onset cardiovascular disease. The aim of this study was to investigate the prevalence and trend of dyslipidemia in Korean youth and its trends for 10 years.

## Materials and Methods

Study subjects were Korean youth aged 10-18 years who participated in the Korea National Health and Nutrition Examination Survey (KNHANES). A total of 7,466 eligible participants ( 3,962 boys, $53.2 \%$ ) with available fasting lipid profile were enrolled. The KNHANES data for 10 years from 2008 to 2017 were divided into five groups at two-year intervals (2008-09, 2010-11, 2012-13, 2014-15, 2016-17). Dyslipidemia was defined using the 2011 National Heart, Lung and Blood Institute (NHLBI) criteria: hypercholesterolemia, total cholesterol $\geq 200 \mathrm{mg} / \mathrm{dL}$; hypertriglyceridemia, triglyceride $\geq 130 \mathrm{mg} / \mathrm{dL}$; hypo-HDL-cholesterolemia, HDL cholesterol < $40 \mathrm{mg} / \mathrm{dL}$; hyper-LDL-cholesterolemia, LDL cholesterol $\geq 130 \mathrm{mg} / \mathrm{dL}$; and hyper-non-HDL-cholesterolemia, non-HDL cholesterol $\geq 145 \mathrm{mg} / \mathrm{dL}$.

## Results

The prevalence of hypercholesterolemia was $6.7 \%$ in 2008-09, $6.5 \%$ in 2010-11, 6.6\% in 2012-13, 7.8\% in 2014-15 and 10.7\% in 2016-17 ( $P$ for trend $<0.001$ ). The prevalence of hypertriglyceridemia was $14.7 \%$ in 2008-09 and $13.0 \%$ in 2016-17 ( P for trend $=0.389$ ). The prevalence of hypo-HDL-cholesterolemia was $16.4 \%$ in 2008-09 and $10.2 \%$ in 2016-17 ( P for trend $<0.001$ ). The prevalence of hyper-LDL-cholesterolemia was $5.4 \%$ in 2008-09 and $7.6 \%$ in 2016-17 ( P for trend $=0.080$ ). The prevalence of dyslipidemia defined by non-HDL level was $9.0 \%$ in 2008-09 and $10.9 \%$ in 2016-17 ( $P$ for trend $=0.105$ ). In logistic regression analyses, the prevalence of hypercholesterolemia was increasing after adjusting age, sex and body mass index (OR 1.14, $95 \% \mathrm{Cl} 1.05-1.22, \mathrm{P}<0.001$ ). In contrast, the prevalence of hypo-HDL-cholesterolemia was decreasing tendency after adjusting age, sex, and body mass index ( $O R 0.82,95 \% \mathrm{CI} 0.78-0.87, \mathrm{P}<0.001$ ). Except for hypo-HDL-cholesterolemia, female predominance was observed.

Table 1. Prevalence of dyslipidemia in Korean youth

| Criteria of Dyslipidemia | Sex | 2008-2009 | 2010-2011 | 2012-2013 | 2014-2015 | 2016-2017 | $P$ value | P for trend |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Total cholesterol $\geq 200(\mathrm{mg} / \mathrm{dL})$ | M | 70 (6.1\%) | 51 (5.6\%) | 33 (3.6\%) | 37 (5.8\%) | 60 (8.9\%) | 0.007 | 0.093 |
|  | F | 73 (7.5\%) | 59 (7.5\%) | 66 (9.9\%) | 46 (10.2\%) | 78 (12.7\%) | 0.018 | <0.001 |
|  | Total | 143 (6.7\%) | 110 (6.5\%) | 99 (6.6\%) | 83 (7.8\%) | 138 (10.7\%) | <0.001 | <0.001 |
| Triglyceride $\geq 130$ ( $\mathrm{mg} / \mathrm{dL}$ ) | M | 161 (15.0\%) | 106 (12.8\%) | 89 (12.6\%) | 83 (14.6\%) | 83 (12.1\%) | 0.574 | 0.366 |
|  | F | 145 (14.4\%) | 91 (12.5\%) | 74 (10.8\%) | 57 (12.0\%) | 86 (14.0\%) | 0.454 | 0.733 |

|  | Total | 185 (9.0\%) | 116 (6.7\%) | 94 (6.2\%) | 82 (7.8\%) | 143 (10.9\%) | <0.001 | 0.105 |

Table 2. Prevalence of dyslipidemia by various diagnostic criteria: trend by year (2008-2017)

| Criteria of Dyslipidemia | Unadjusted |  |  | Adjusted* |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | OR | 95\% Cl | $P$ value | OR | 95\% CI | $P$ value |
| Total cholesterol $\geq 200(\mathrm{mg} / \mathrm{dL})$ | 1.14 | 1.06, 1.22 | <0.001 | 1.14 | 1.05, 1.22 | <0.001 |
| Triglyceride $\geq 130$ ( $\mathrm{mg} / \mathrm{dL}$ ) | 0.97 | 0.92, 1.03 | 0.389 | 0.96 | 0.90, 1.02 | 0.199 |
| HDL cholesterol <40 (mg/dL) | 0.85 | 0.80, 0.90 | <0.001 | 0.82 | 0.78, 0.87 | <0.001 |
| LDL cholesterol $\geq 130(\mathrm{mg} / \mathrm{dL})$ | 1.08 | 0.99, 1.17 | 0.08 | 1.07 | 0.98, 1.16 | 0.142 |
| Non-HDL cholesterol $\geq 145$ ( $\mathrm{mg} / \mathrm{dL}$ ) | 1.06 | 0.99, 1.14 | 0.105 | 1.05 | 0.97, 1.13 | 0.228 |

*Adjusted for age, sex, and body mass index

## Conclusions

In Korean youth, the prevalence of hypercholesterolemia showed increasing tendency over the last 10 years. It was obvious especially in female population. However, the prevalence of hypo-HDL-cholesterolemia showed decreasing tendency over the last 10 years. Further research is needed to investigate associated factors with this trend.

Nothing to declare.
