## OBJECTIVES

To reveal how many children who have the extent physique problems from height and weight data obtained from school health check of the ward there are. To build a regional cooperation system not to miss the patients who hospital consultation from the onset becomes too late.

## METHODS

We analyzed the height and weight data which had been input to the academic affairs system and which were the total of 11 times in the school medical examination from September 2012 to April 2014. School nurse measures height and weight of students 3 times a year.

$$\text{Percentage of overweight (POW)} = \frac{[\text{measured weight}] - [\text{standard weight for height}]}{[\text{standard weight for height}]} \times 100(\%)$$

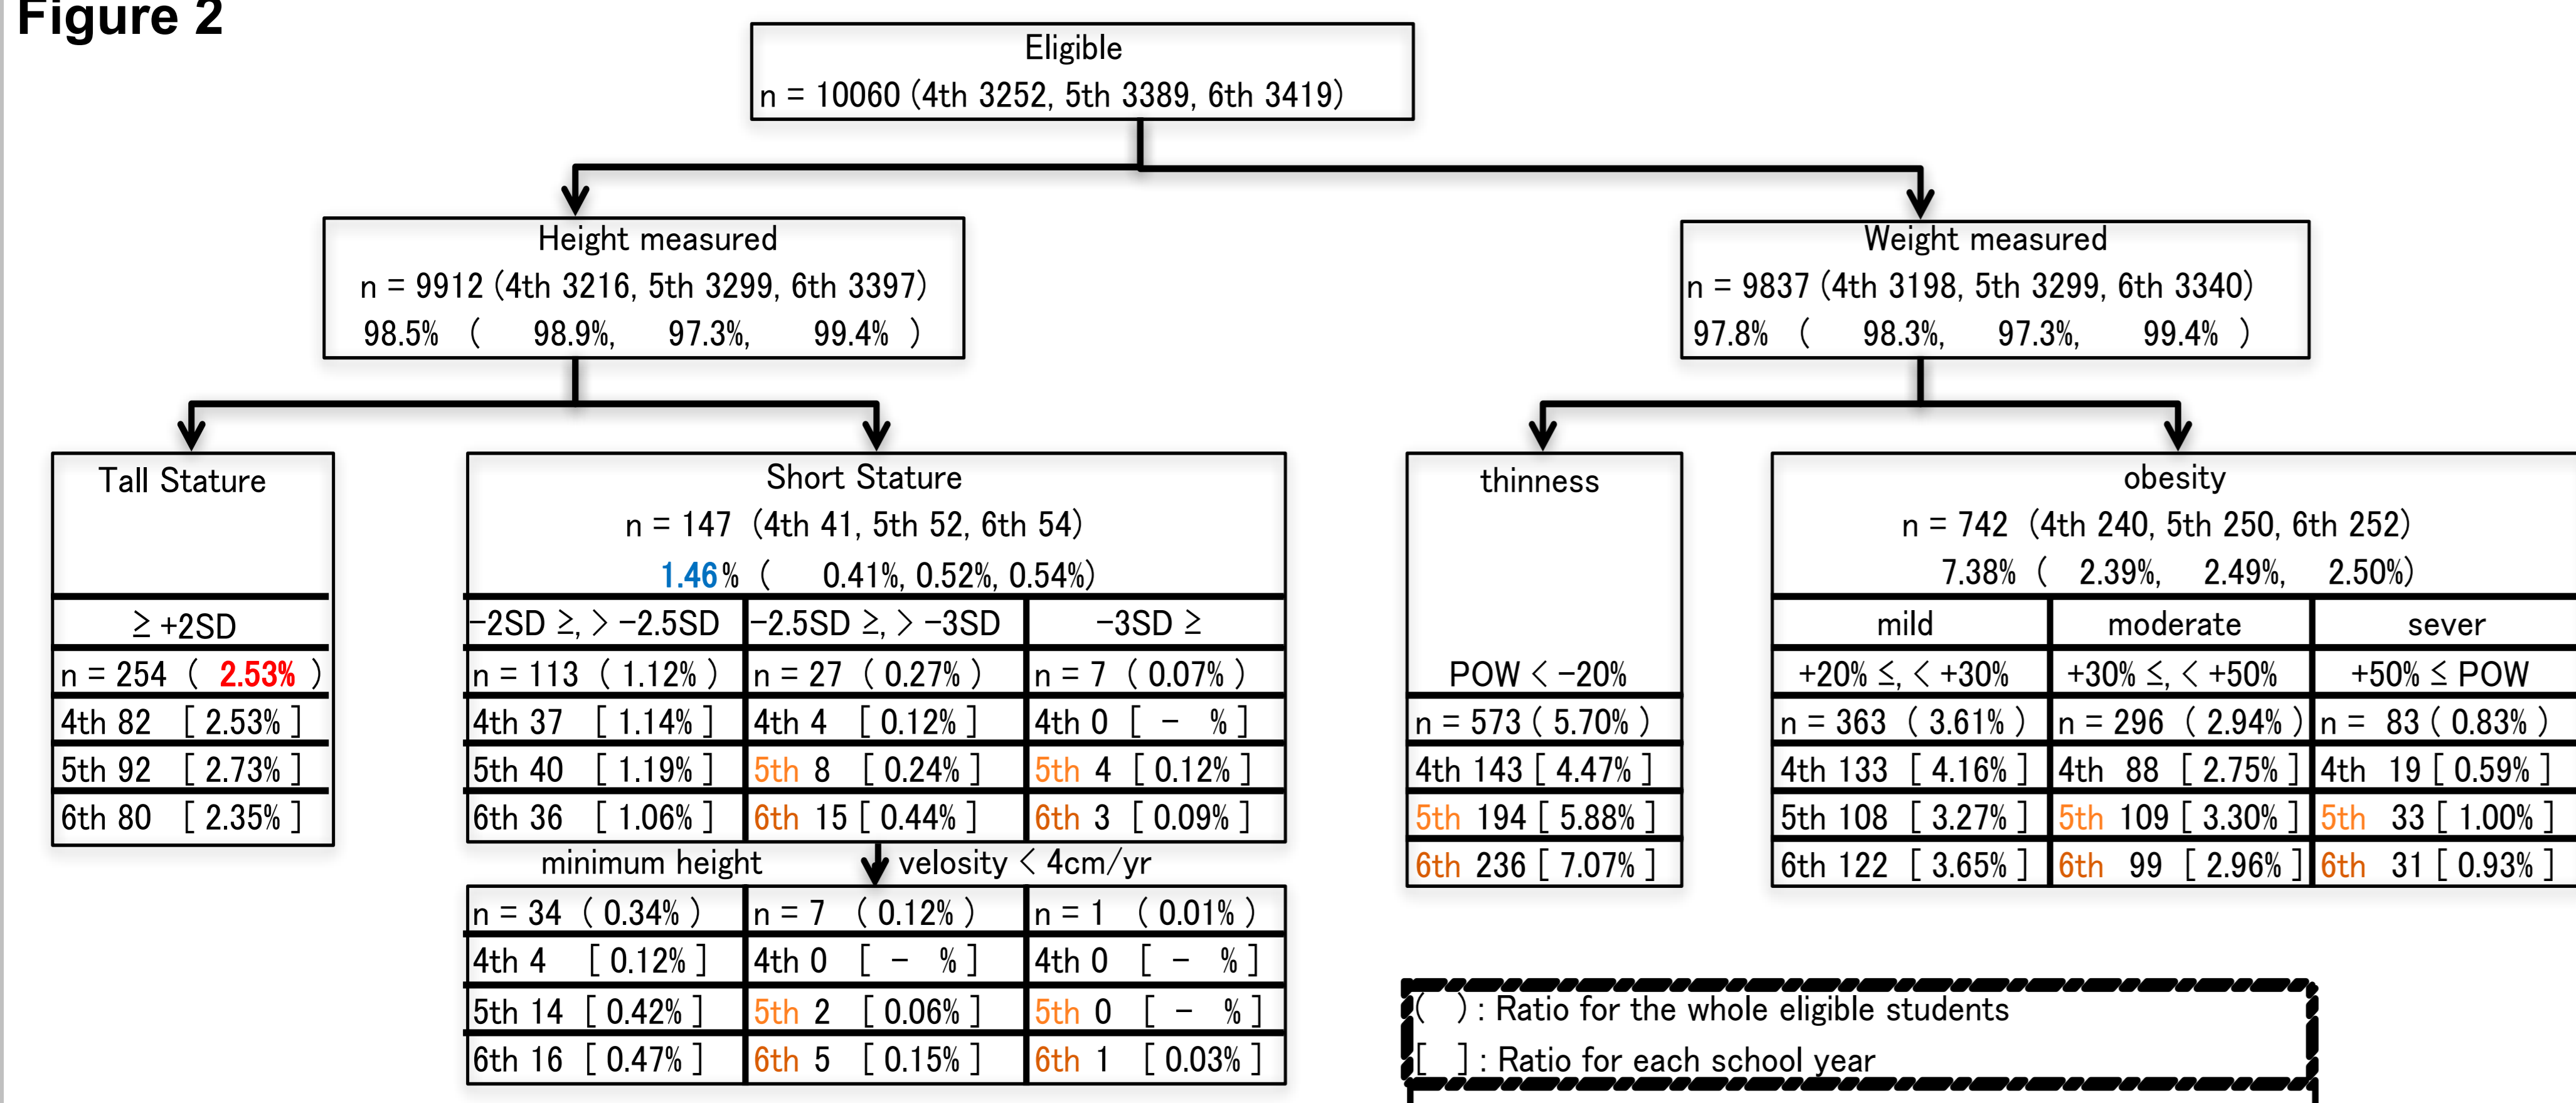

- +50% ≤ POW : severely obesity
- +30% ≤ POW < +50% : moderately obesity
- +20% ≤ POW < +30% : mildly obesity
- 20% ≤ POW < +20% : health weight
- POW < -20% : thinness

In Japan ordinary used to percentage of overweight rather than BMI percentile/Z-score. This is because it tends to be judged with a thinness in the low height children, on the other hands, and an obesity in the high height children by the BMI percentile method<sup>1</sup>.

male age	a	b	female age	a	b
5	0.386	-23.699	5	0.377	-22.750
6	0.461	-32.382	6	0.458	-32.079
7	0.513	-38.878	7	0.508	-38.367
8	0.592	-48.804	8	0.561	-45.006
9	0.687	-61.390	9	0.652	-56.992
10	0.752	-70.461	10	0.730	-68.091
11	0.782	-75.106	11	0.803	-78.846
12	0.783	-75.642	12	0.796	-76.934
13	0.815	-81.348	13	0.655	-54.234
14	0.832	-83.695	14	0.594	-43.264
15	0.766	-70.989	15	0.560	-37.002
16	0.656	-51.822	16	0.578	-39.057
17	0.672	-53.642	17	0.598	-42.339

## RESULTS

Figure 2

## CONCLUSIONS

Unlike the ratio of child of the high height, the ratio of low height child was about 1.4% and was not according to normal distribution. According to the school year it goes up, because the students that have problems in physique (thinness, obesity, short stature, poor height velocity) was observed tends to increase, there is a need for early intervention. Some reports show height screening is efficient economically<sup>3</sup>.
